000	0000	0	0	0
Europe C		to Discusto Time		

From Continuous-Time to Discrete-Time NRNNs

We consider explicit Euler-Maruyama (E-M) integrators, which are the stochastic analogues of Euler-type integration schemes for ODEs.

- Let  $0 = t_0 < t_1 < \cdots < t_M = T$  be a partition of the interval [0, T]. Denote  $\delta_m := t_{m+1} t_m$  for each  $m = 0, 1, \dots, M 1$ , and  $\delta := (\delta_m)$
- The E-M scheme provides a family (parametrized by  $\delta$ ) of approximations to the solution of the SDE in (6):

Discrete-Time NRNNs

$$h_{m+1}^{\delta} = h_m^{\delta} + f(h_m^{\delta}, \hat{x}_m)\delta_m + \sigma(h_m^{\delta}, \hat{x}_m)\sqrt{\delta_m}\xi_m,$$
(9)

for m = 0, 1, ..., M - 1, where  $(\hat{x}_m)_{m=0,...,M-1}$  is a given sequential data, the  $\xi_m \sim \mathcal{N}(0, I)$  are independent *r*-dimensional standard normal random vectors, and  $h_0^{\delta} = h_0$
