Recap - Tackling MIS with ML & DP

- Maximum Independent Set (MIS) is an NP-hard problem in combinatorial optimization.
- Machine Learning (ML) models have shown promise in addressing NP-hard problems [1, 2, 3].
- Dynamic Programming (DP) offers an algorithmic framework by combining solutions of sub-instances.
- ▶ We explore the synergy between DP and ML to develop a learning-based algorithm for MIS.
- ▶ Our approach involves employing a Graph Neural Network (GNN) to navigate through the DP tree.

Algorithmic structure

Divide: Pick random node $v \in V$ from G, create $G/\mathcal{N}(v), G/\{v\}$ based on the theoretical assumption:

$$G_0 = G/\mathcal{N}(v), \ G_1 = G/\{v\} \qquad \to \qquad |\mathrm{MIS}(G)| = \max(|\mathrm{MIS}(G_0)|, |\mathrm{MIS}(G_1)|). \tag{1}$$

Figure: Generation of graphs G_0 , G_1 given that node $v = v_2$ has been randomly picked.

Branch: GNN model (denoted as *comparator* (CMP_{θ})) estimates the higher MIS:

$$\operatorname{CMP}_{\theta}(G_0, G_1) \simeq \mathbb{I}[|\operatorname{MIS}(G_0)| < |\operatorname{MIS}(G_1)|].$$

Self-training pipeline

Assumption

A consistent comparator corresponds to an optimal algorithm. Thus, the goal of training is to find the set of parameters $\theta^* \in \Theta$ such that for all $G_0, G_1 \in \mathcal{G}$:

$$\operatorname{CMP}_{\theta^{\star}}(G_0, G_1) = 0 \text{ if and only if } \mathbb{E}\left[\left|\mathcal{A}^{\operatorname{CMP}_{\theta^{\star}}}(G_0)\right|\right] \ge \mathbb{E}\left[\left|\mathcal{A}^{\operatorname{CMP}_{\theta^{\star}}}(G_1)\right|\right]$$

Main results

Our Model Performance:

Outperforms all prior Deep-Learning-Based (DLB) methods across datasets.

Table: Test set results. A higher number corresponds to a better performance. The best results are in bold.

Method (\downarrow) Dataset ($ ightarrow$)	RB	COLLAB	TWITTER	SPECIAL
Our model	0.836	0.990	0.977	0.996
Best DLB method	0.813	0.978	0.972	0.946

• Generalizes well in out-of-distribution structures, indicating robust pattern extraction.

Open direction

How can the interplay between Dynamic Programming and self-training techniques pave the way for new deep-learning-oriented approaches for demanding Combinatorial Optimization problems?
