## ETHzürich

effects mismatch =  $W_2(\mu_1, \hat{\mu}_1)^2$ 

#### Motivation

• Diffusion processes are widespread in many natural processes. • Typically characterized by three terms: a drift term due to a potential field, the interaction with other particles, and a stochastic term. • Existing methods either rely on having access to particles trajectories (often not possible) or are data and compute inefficient.

#### The JKO scheme

The Fokker-Planck equation,

 $\frac{\partial \rho(t,x)}{\partial t} = \nabla \cdot (\nabla V(x)\rho(t,x)) + \beta \nabla^2 \rho(t,x),$ 

describes the time evolution of the distribution  $\rho$  of a set of particles undergoing drift and diffusion,

$$\mathrm{d}X(t) = -\nabla V(X(t))\mathrm{d}t + \sqrt{2\beta}\mathrm{d}W(t),$$

where X(t) is the state of the particle, V(x) the driving potential, and W(t) the Wiener process. It turns out the resulting particles trajectory can be described via the JKO scheme:

$$\mu_{t+1} = \operatorname*{argmin}_{\mu \in \mathcal{P}(\mathbb{R}^d)} J(\mu) + \frac{1}{2\tau} W_2(\mu, \mu_t)^2,$$

where J is an energy functional and  $\tau > 0$  is the time discretization. A general energy functional:

$$\mathcal{J}(\mu) = \underbrace{\int_{\mathbb{R}^d} \mathcal{V}(x) d\mu(x)}_{\text{potential}} + \underbrace{\int_{\mathbb{R}^d \times \mathbb{R}^d} \mathcal{U}(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)(x, y)}_{\text{interaction}} + \underbrace{\beta \int_{\mathbb{R}^d} \rho(x - y) d(\mu \times \mu)$$

#### Intuition in $\mathbb{R}^d$

Consider the analog of (1) in the  $\mathbb{R}^d$ ,

$$x_{t+1} = \operatorname*{argmin}_{x \in \mathbb{R}^d} J(x) + \frac{1}{2\tau} ||x - x_t||^2.$$

We replace the above by its first-order optimality condition

$$\boldsymbol{\nabla}J(x_{t+1})+\frac{1}{\tau}(x_{t+1}-x_t)=0.$$

Given a dataset  $(x_0, x_1, \ldots, x_T)$ , we find J as:

$$\min_{J} \sum_{t=0}^{T-1} \left\| \nabla J(x_{t+1}) + \frac{1}{\tau} (x_{t+1} - x_t) \right\|^2.$$

Our work enables an analogous result in the Wasserstein space.

#### 38th Conference on Neural Information Processing Systems (NeurIPS 2024, oral)

# Learning diffusion at lightspeed

 $(x)\log(\rho(x))dx$ .

#### First-order optimality conditions for the JKO scheme

Our analysis suggest that given a populations dataset  $(\mu_0, \mu_1, \ldots, \mu_T)$ we seek the parameters  $\theta$  minimizing

$$\begin{split} \sum_{t=0}^{T-1} \int_{\mathbb{R}^{d} \times \mathbb{R}^{d}} \left\| \boldsymbol{\nabla} V_{\theta}(x_{t+1}) + \int_{\mathbb{R}^{d}} \boldsymbol{\nabla} U_{\theta}(x_{t+1} - x_{t+1}') \mathrm{d} \mu_{t+1}(x_{t+1}') \right. \\ \left. + \beta_{\theta} \frac{\boldsymbol{\nabla} \rho_{t+1}(x_{t+1})}{\rho_{t+1}(x_{t+1})} + \frac{1}{\tau} (x_{t+1} - x_{t}) \right\|^{2} \mathrm{d} \gamma_{t}(x_{t}, x_{t+1}), \, (2) \end{split}$$

where  $\gamma_0, \gamma_1, \ldots, \gamma_T$  are optimal transport plans between  $\mu_t$  and  $\mu_{t+1}$ .

- $\gamma_t$  can be computed once, before-hand, and efficiently;
- when  $J_{\theta}$  is a neural network, we minimize (2) via gradient descent;
- when  $J_{\theta}$  is parametrized linearly, we have a closed-form solution.

### Training at lightspeed

Different potential V(x) driving the diffusion.

#### **Eye-candies**

Level curves of different potentials (green: real; blue: estimated).

### Learning general energy terms

Additional error sources: • Sampling error (internal energy) • Estimation of the densities **Nonetheless: our method (**JKOnet<sup>\*</sup>, non-linear and linearly parametrized) recovers all the energy terms. Open question: observability of the different energy terms?

### Learning single-cell diffusion dynamics

- State-of-the-art accuracy at a fraction

### **Cool stuff worth looking at next**

• Fast distillation of diffusion models for one- or few-steps generation;

- in your work? Reach out!

• Intuition: cellular evolution minimizes (some) energy; • We can account for unobserved variables via time-varying energies; of the computational cost of the other methods: less than minute vs hours.

• Observability of the different energy terms; • Can optimality conditions in  $\mathcal{P}(\mathbb{R}^d)$  be helpful
