Diffusion Flow Matching (DFM) in Brief

Goal:

 Generate new data x ~ ν^{*} ∈ P(ℝ^d) by learning from existing ones and leveraging a base distribution μ ∈ P(ℝ^d).

Strategy:

- Build a **Stochastic Interpolant** to interpolate between ν^{\star} and μ ;
- Build a Markovian Approximation to simplify the structure.

Figure: Figure 1 in (Alberto et al., 2023)

Albergo, Michael S and Boffi, Nicholas M and Vanden-Eijnden, Eric (2023) Stochastic interpolants: A unifying framework for flows and diffusions. In *arXiv preprint arXiv:2303.08797*.

Stochastic Interpolant

Definition:

The stochastic interpolant between μ and ν^{\star} is process $(X_t^{I})_{t \in [0,1]}$ s.t.

 $(X_0^{\rm I}, X_1^{\rm I}) \sim \pi \in \Pi(\mu, \nu^{\star}) \;,\; (X_t^{\rm I})_{t \in [0,1]} | (X_0^{\rm I}, X_1^{\rm I}) \sim \mathrm{b} \mathbb{B}((X_0^{\rm I}, X_1^{\rm I}), \cdot) \;,$

with $\Pi(\mu, \nu^*)$ set of couplings between μ and ν^* and $b\mathbb{B}((x_0, x_1), \cdot)$ Brownian bridge between $x_0, x_1 \in \mathbb{R}^d$.

Remark:

It evolves accordingly to

 $\mathrm{d} X_t^\mathrm{I} = 2 \nabla \log p_{1-t}(X_1^\mathrm{I} | X_t^\mathrm{I}) \mathrm{d} t + \sqrt{2} \mathrm{d} B_t \ , \ t \in [0,1] \ , \ X_0^\mathrm{I} \sim \mu \ ,$

with $(s, x, y) \mapsto p_s(x|y)$ heat kernel.

Markovian Projection

Definition:

The Markovian projection of the stochastic interpolant is the Markovian process $(X_t^M)_{t \in [0,1]}$ such that

$$(X^{\mathrm{M}}_t)_{t\in[0,1]}$$
 : $X^{\mathrm{M}}_t \stackrel{\mathrm{dist}}{=} X^{\mathrm{I}}_t$, $\forall t \in [0,1]$.

Markovian Projection

Definition:

The Markovian projection of the stochastic interpolant is the Markovian process $(X_t^M)_{t \in [0,1]}$ such that

$$(X_t^{\mathrm{M}})_{t\in[0,1]}$$
 : $X_t^{\mathrm{M}} \stackrel{\mathrm{dist}}{=} X_t^{\mathrm{I}}$, $\forall t \in [0,1]$.

Key point: [Corollary 3.7 in (G. Brunick and S. Shreve, 2013)] $(X_t^{\text{M}})_{t \in [0,1]}$ is a solution to the Markovian SDE

 $\mathrm{d} X^{\mathrm{M}}_t = \tilde{\beta}_t(X^{\mathrm{M}}_t) \mathrm{d} t + \sqrt{2} \mathrm{d} B_t \; , \; t \in [0,1] \; , \; X^{\mathrm{M}}_0 \sim \mu \; ,$

with drift $\tilde{\beta}_t(x) = \mathbb{E}[2\nabla_x \log p_{1-t}(X_1^{\mathrm{I}}|X_t^{\mathrm{I}})|X_t^{\mathrm{I}} = x].$

G. Brunick and S. Shreve (2013). Mimicking an Itô process by a solution of a stochastic differential equation. In *The Annals of Applied Probability*.

Draft Idea: To match ν^* , we run the SDE satisfied by the Markovian projection of the stochastic interpolant.

Algorithm 1 Draft algorithm

- 1: Input: μ .
- 2: Step 1: Initialize $X_0^{\mathrm{M}} \sim \mu$.
- 3: Step 2: Compute

$$\mathrm{d} X^{\mathrm{M}}_t = \tilde{\beta}_t(X^{\mathrm{M}}_t) \mathrm{d} t + \sqrt{2} \mathrm{d} B_t, \quad t \in [0,1].$$

4: **Output:** Law $(X_1^M) = \nu^*$.

DFM algorithm

Key Idea: To approximate ν^* , we run the Euler–Maruyama scheme for the estimated mimicking drift (via neural networks).

Algorithm 1

- 1: Input: μ , $\{0 = t_0 < t_1 < \cdots < t_N = 1\}.$
- 2: Step 1: Initialize $X_0^{\star} \sim \mu$.
- 3: Step 2: For each k = 0, ..., N 1:
- 4: Approximate $\tilde{\beta}_{t_k}(x)$ using $s_{\theta^*}(t_k, x)$.
- 5: Compute the update:

$$\mathrm{d} X_t^\star = s_{\theta^\star}(t_k, X_{t_k}^\star) \mathrm{d} t + \sqrt{2} \mathrm{d} B_t, \quad t \in [t_k, t_{k+1}].$$

6: **Output:** $\nu_1^{\theta^\star} := \operatorname{Law}(X_1^\star).$

Non-Asymptotic Guarantees for DFM Models

- Consider a uniform grid {kh}_k for discretizing time and assume the mimicking drift is estimated with precision ε².
- Solution Further assume that μ , ν^* , and the score functions associated with μ , ν^* , and π (*i.e.* $\nabla \log(d \cdot / dLeb)$) have finite 8th-order moments.

Theorem 2 in (Gentiloni-Silveri et al., 2024)

Under these conditions, the Kullback-Leibler (KL) divergence between the output distribution and the target is bounded by:

 $\mathsf{KL}(\mathsf{output}||\nu^{\star}) \leq \epsilon_{\mathsf{estimation}} + \epsilon_{\mathsf{discretization}}$

where $\epsilon_{\text{estimation}} = \epsilon^2$, $\epsilon_{\text{discretization}} = h(h^{1/8} + 1)(d^4 + 8\text{th-order-moments})$.
