

# Parameter Efficient Adaptation for Image Restoration with Heterogeneous Mixture-of-Experts

Hang Guo¹, Tao Dai²,\*, Yuanchao Bai³, Bin Chen³, Xudong Ren¹, Zexuan Zhu¹, Shu-tao Xia¹,4 <sup>1</sup>Tsinghua University; <sup>2</sup>Shenzhen University; <sup>3</sup>Harbin Institute of Technology; <sup>4</sup>Peng Cheng Laboratory \*Corresponding author

Directly applying current PETL methods to image restoration

- Unstable performance on single degradation
- Sub-optimal results on hybrid degradation

#### Motivation Fourier analysis on LoRA (d) Fourier analysis on Ours (c) Fourier analysis on FacT — Heavy Rain Streak Remova - Heavy Rain Streak Removal Light Rain Streak Removal — Light Rain Streak Removal Super-resolution Super-resolution

#### Reasons behind observation

- Existing methods exhibit homogeneous frequency representations even when faced with different degradations, i,.e., they cannot figure out different degradations.
- This problem hinders them to learn different representations for different degradations, leading to the above phenomenon

#### Solution

We can use the structure of Mixture-of-Experts to learn distinct representations for different degradations!

#### Challenge 1:

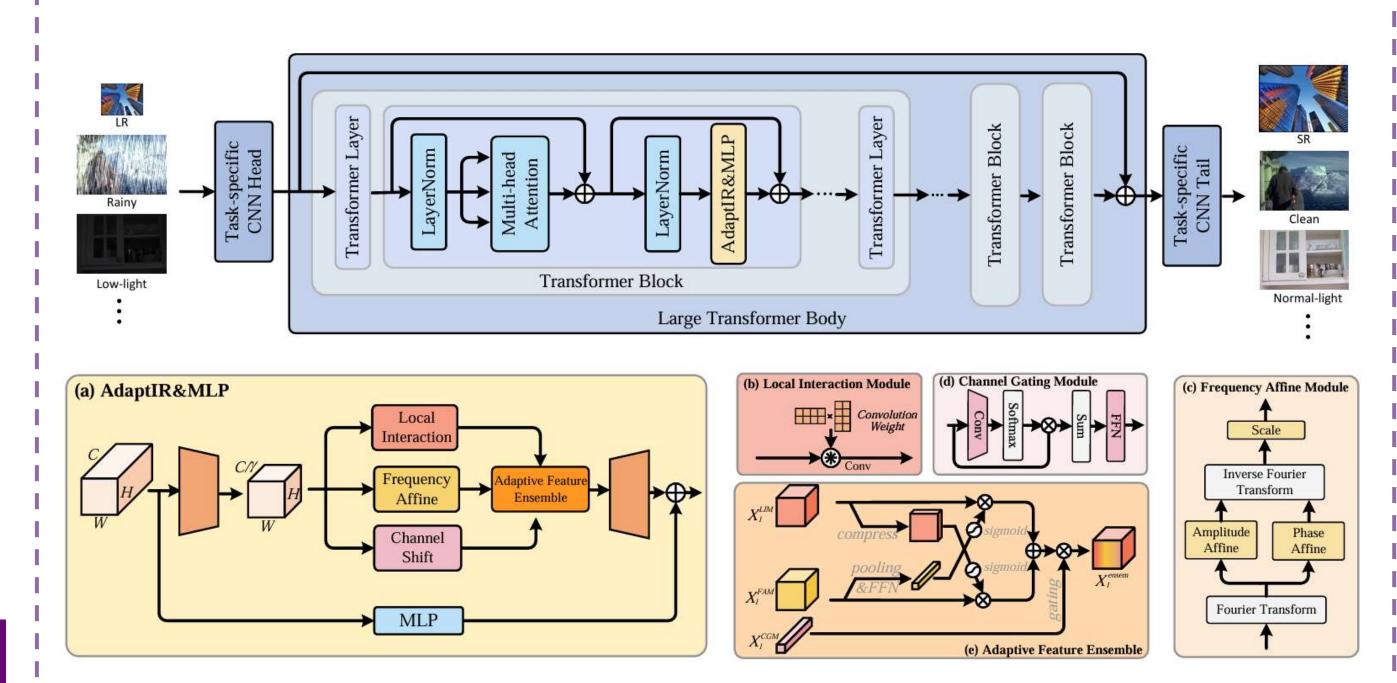

How to learning distinct representation? There is danger from the mode collapse to one representation

## Challenge 2:

How to learning distinct representation under low parameter budgets?

# Method

#### Overview

- Designing orthogonal branches to force the learning of heterogeneous representations!
- Local Interaction Module local spatial modeling

$$W' = UV^{\top}$$

$$W' = UV'$$
$$X_l^{LIM} = \text{Reshape}(W') \circledast X_l^{intrin}$$

Frequency Affine Module

global spatial modeling

$$[Mag_l, Pha_l] = FFT(X_l^{intrin}),$$
  

$$X_l^{FAM} = Conv(iFFT(to\_complex(\phi_1(Mag_l), \phi_2(Pha_l)))),$$

Channel Gating Module

channel modeling

$$\mathcal{M}_l = \operatorname{Softmax}(\operatorname{Conv}(X_l^{intrin}))$$

$$X_l^{CGM} = \text{FFN}(\sum_{l,w} \mathcal{M}_l \otimes X_l^{intrin})$$

Adaptive Feature Ensemble

# **Advantages of AdaptIR**

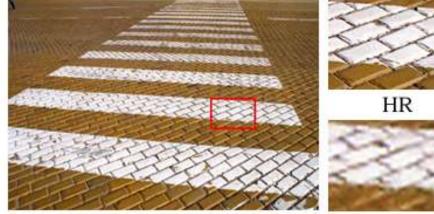

High efficiency: Tuning only 0.6% of pretrained parameters within 8h!

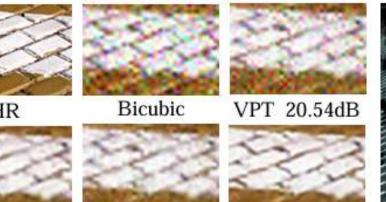

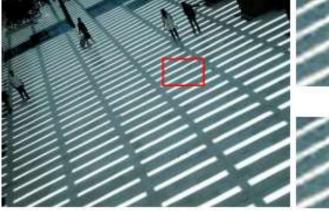

#### **Comparison to SoTA**
