Institute of Science and Technology<sup>3</sup>

# Introduction

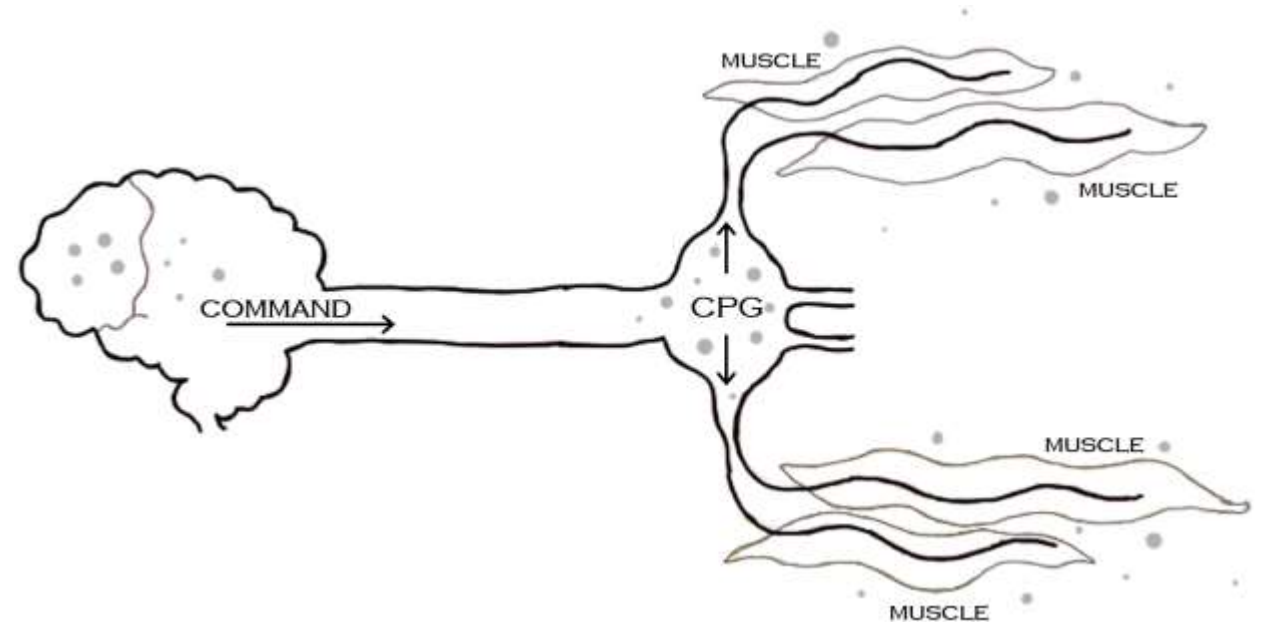

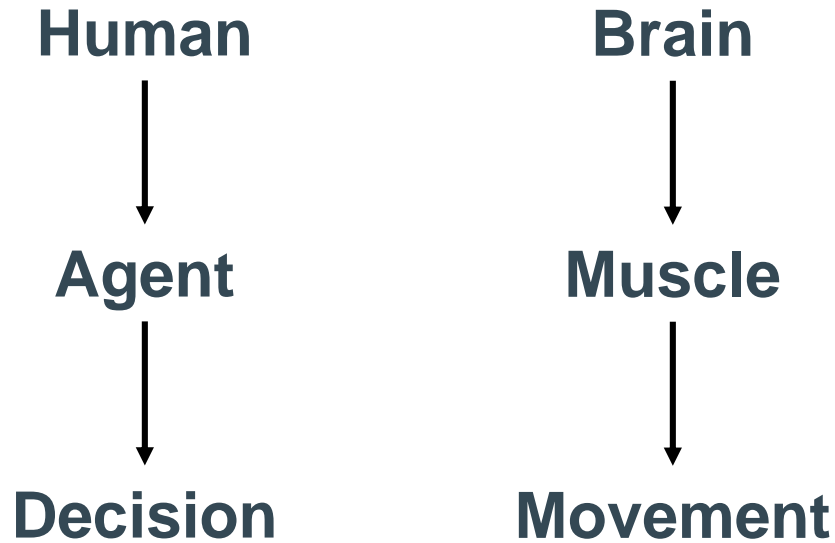

---

- **Learning difficulty in large-scale MAS:** Sample inefficiency and curse of dimensionality make it challenging to learn from scratch;
- **Human-On-The-Loop:** As the most intuitive and common source, humans can provide demonstrations for agents by personally executing tasks;
- **Human burden mitigation:** Providing step-by-step demonstrations in MAS can be overwhelming.

# Intuition

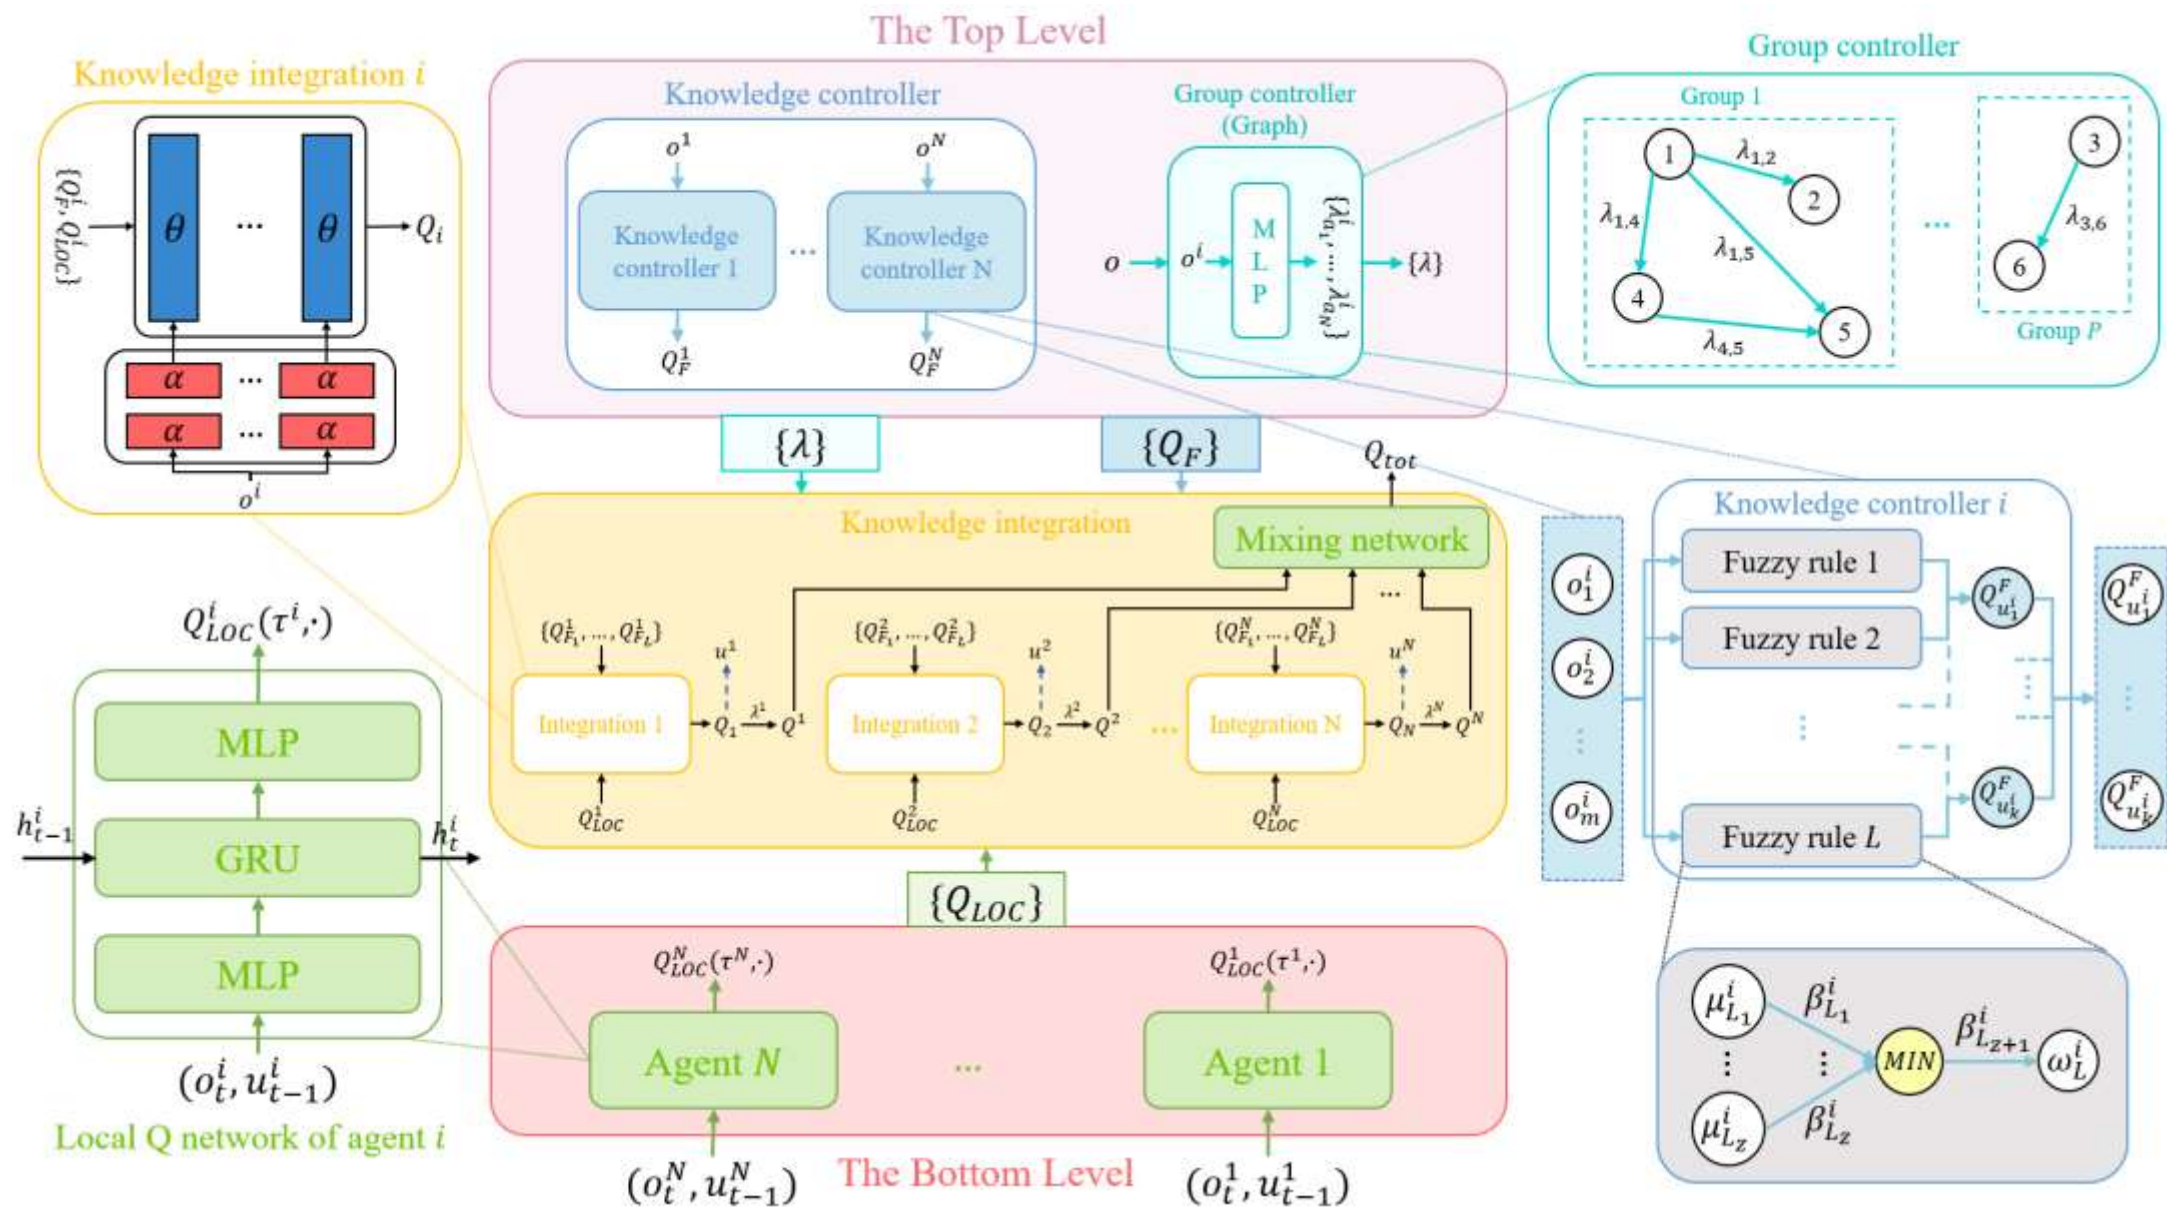

Inspired by the hierarchical control of human daily activity, we attempt to integrate abstract human knowledge into MARL algorithms

Human daily hierarchical control

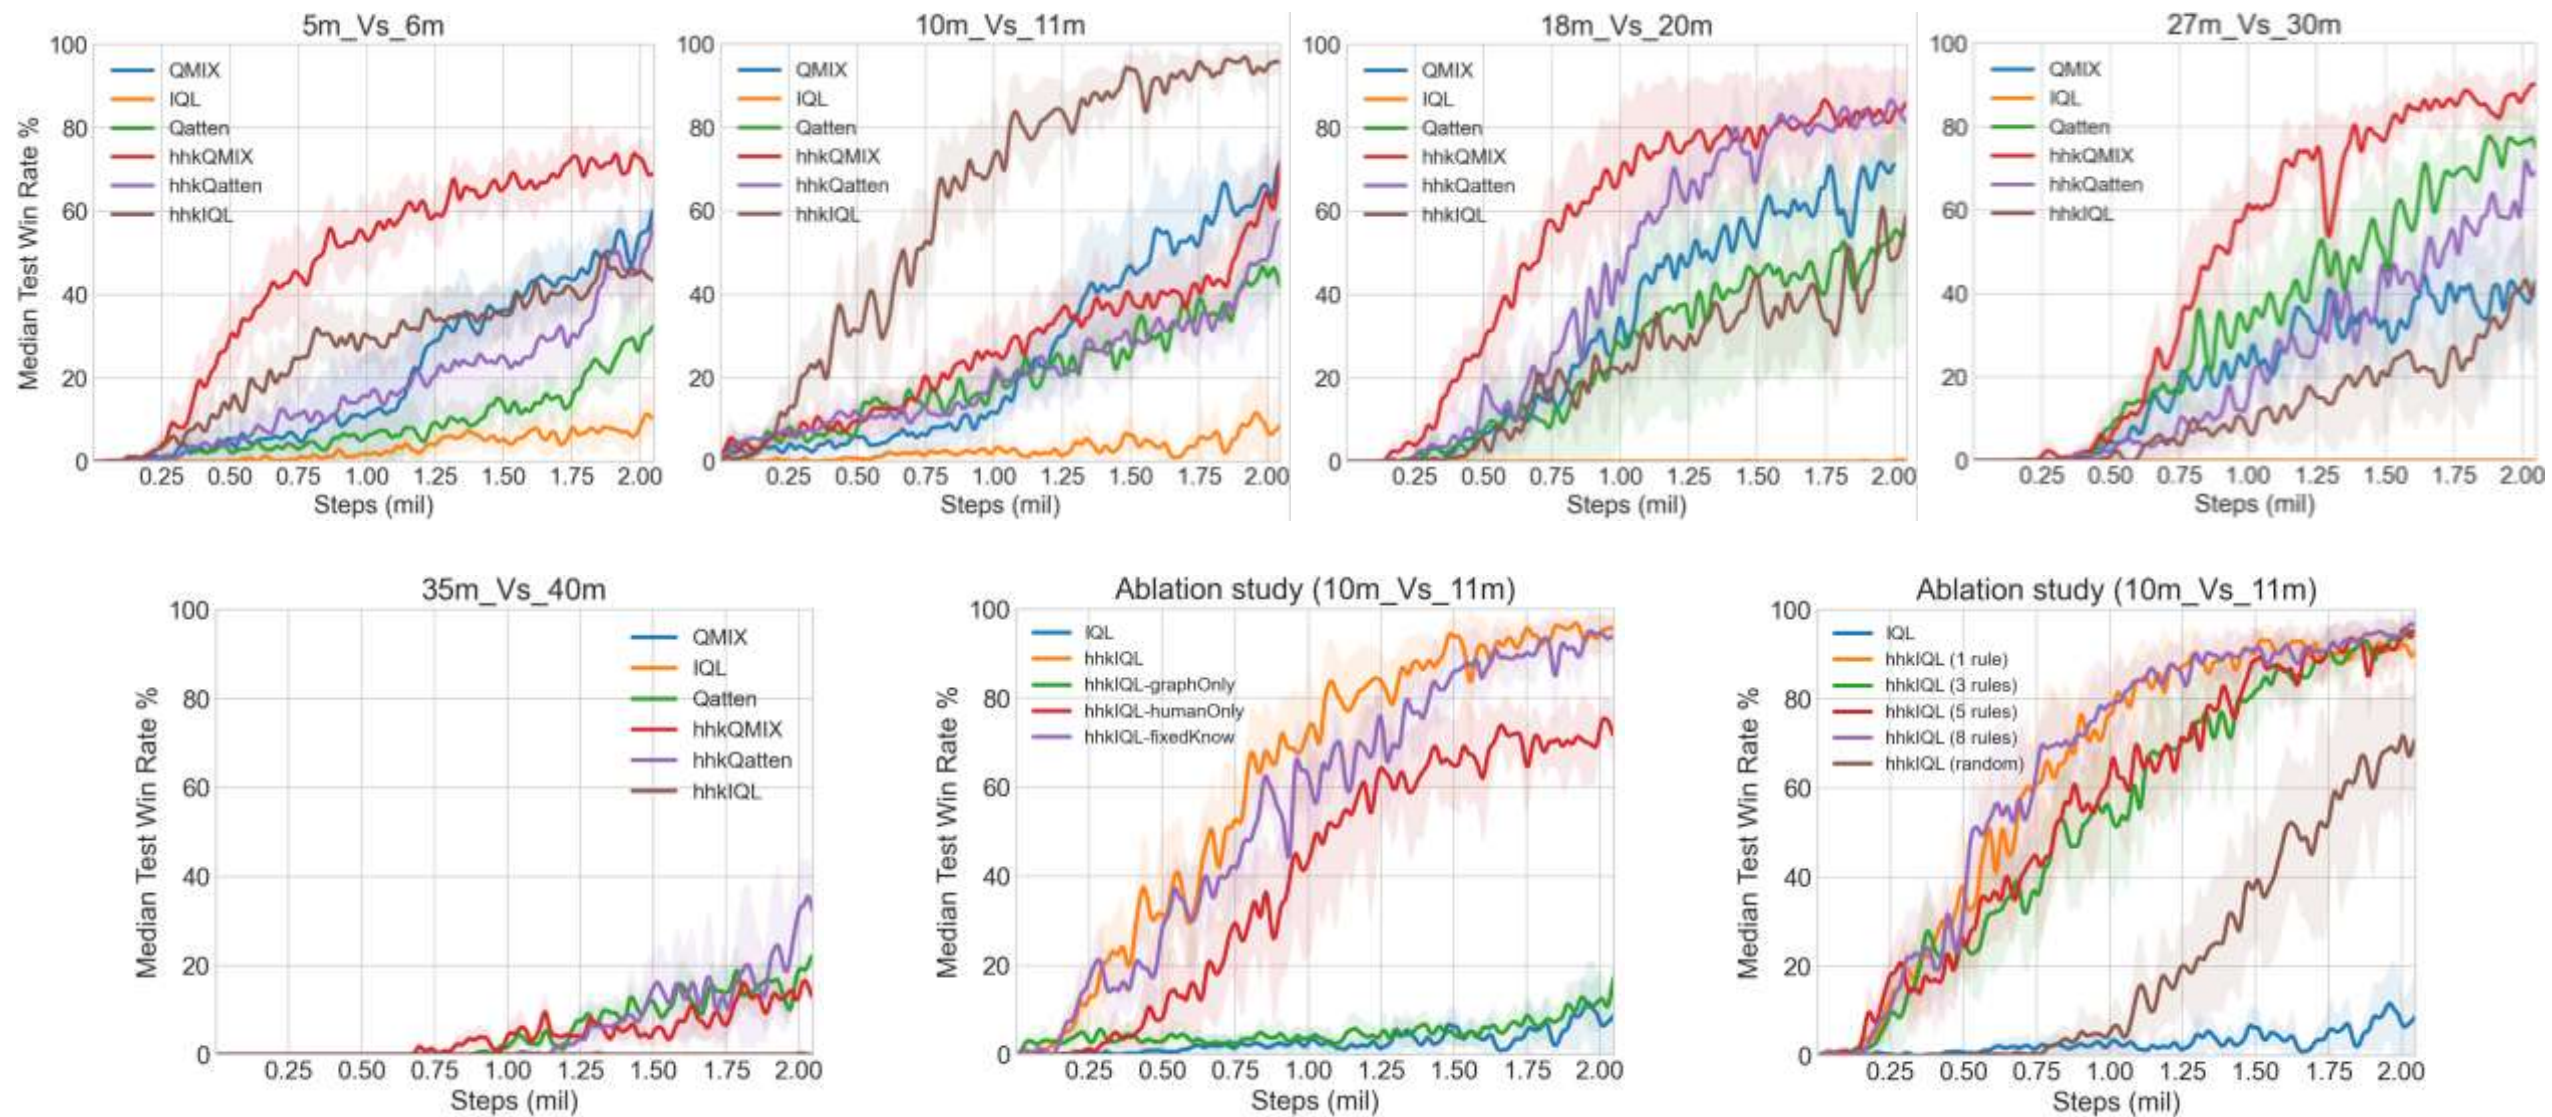

Humans are naturally adept at abstracting and providing high-level knowledge, while agents are expected to autonomously decide the utilization of the proposed knowledge.

# Methodology

# Experiment

# Conclusion

---

- **A novel hierarchical learning framework for enhancing coordination in large-scale MAS by leveraging suboptimal human knowledge;**
- **Allowing humans to provide knowledge at the top level while agents develop their own policies at the bottom;**
- **This end-to-end method can help improve learning speed and final performance, even when integrating low-performance human knowledge.**
